Post-doctoral position in Plant Epigenetics

A postdoctoral position is available in the Department of Plant and Microbial Biology, North Carolina State University, at the North Carolina Research Campus to participate in an NSF-funded research project focusing on understanding the molecular mechanism of DEMETER-mediated active DNA demethylation during plant reproduction.

This position requires experience in genome scale data generation e.g., BS-seq, RNA-Seq, ChIP-Seq, and bioinformatics analysis. Basic background in protein biochemistry is desirable. Candidate should have a PhD in plant biology, molecular genetics, developmental biology, or related fields with solid experimental skills. Successful candidate must be able to independently design and conduct experiments and be able to work collaboratively with other members of the laboratory.

This position is available immediately. Please submit application through https://jobs.ncsu.edu/postings/125491

For additional information, please contact Dr. Tzung-Fu Hsieh (thsieh3@ncsu.edu)
