A Postdoctoral Researcher Position at Seoul National University

Ji-Young Lee Lab is looking for a highly motivated postdoctoral researcher who will perform the research on understanding the molecular basis of radial growth in radish roots. The job candidate will perform the analysis and validation of tissue specific transcript profiling data in radish and try to find key genes responsible for variations in radish root growth. Radish (Brassicaceae) is a nice root crop for studying radial root growth because it takes only nine weeks to produce root biomass weighing more than 1kg and it is a close relative to Arabidopsis.

The postdoctoral researcher should have strong knowledge and skills in basic plant development and genetics/genomics or molecular breeding, with good communication skills and scientific publications.

To apply, send a brief statement of research interest and a CV with the names of three references to Ji-Young Lee (jl924@snu.ac.kr). The application will be reviewed beginning on March 10th and the position will be open until it is filled.
